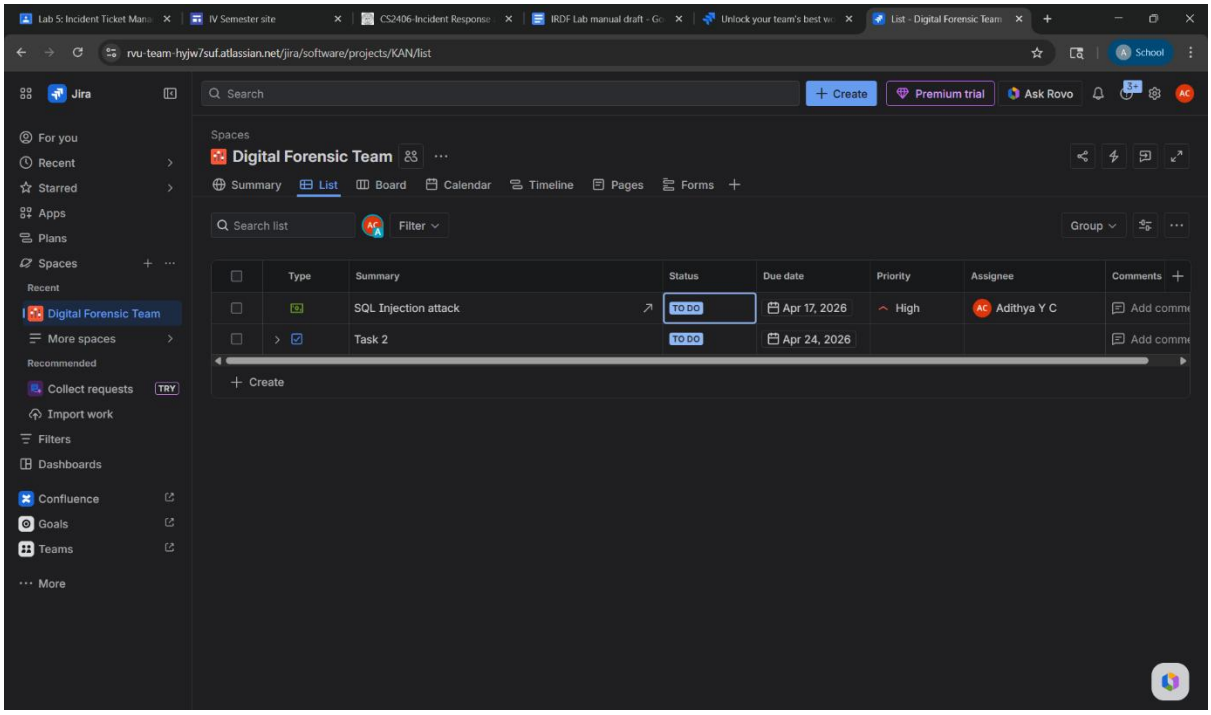
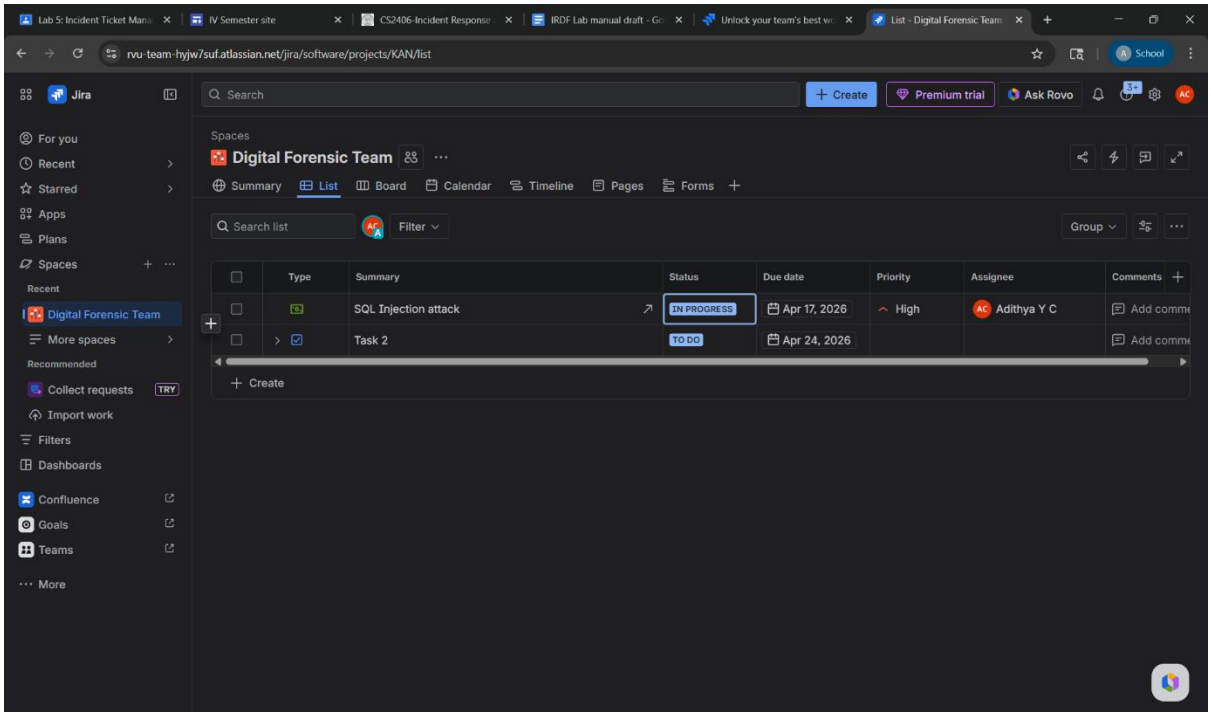
LAB EXPERIMENT - 5

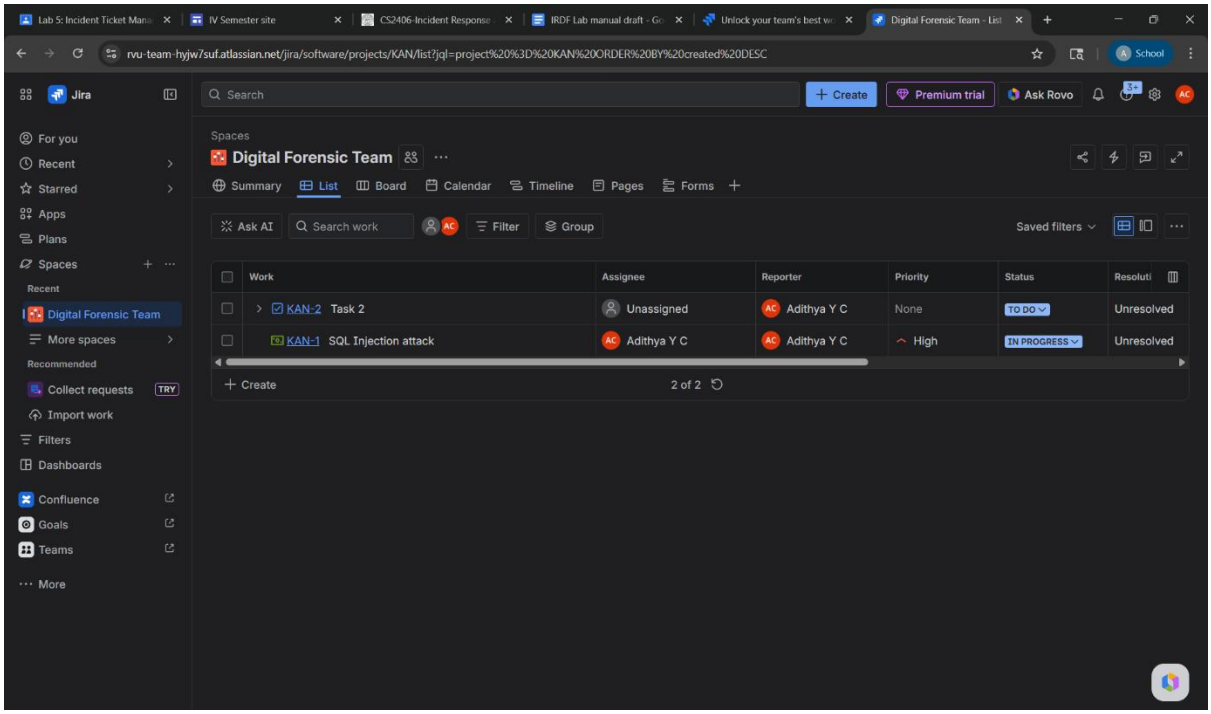
EXPERIMENT 5: INCIDENT TICKET MANAGEMENT IN JIRA / RT



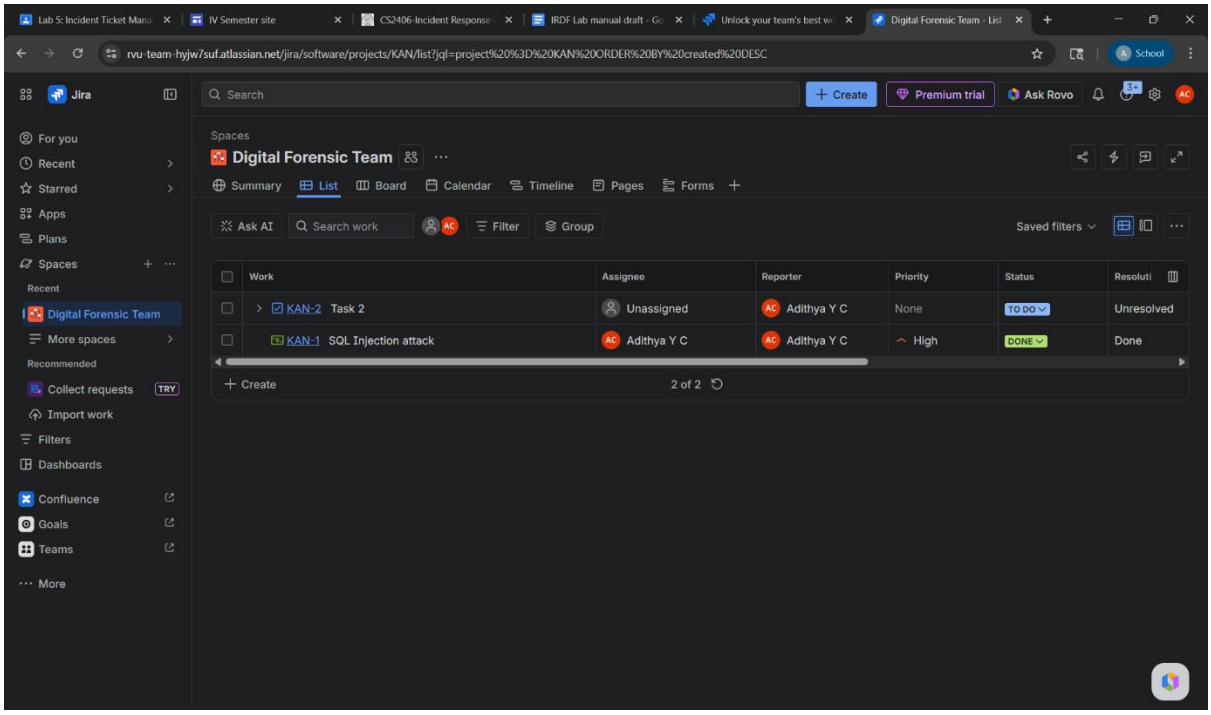
The "SQL Injection attack" incident is logged into the Jira system with a status of "TO DO". It establishes the starting point for the incident response lifecycle by defining the security event to be managed.



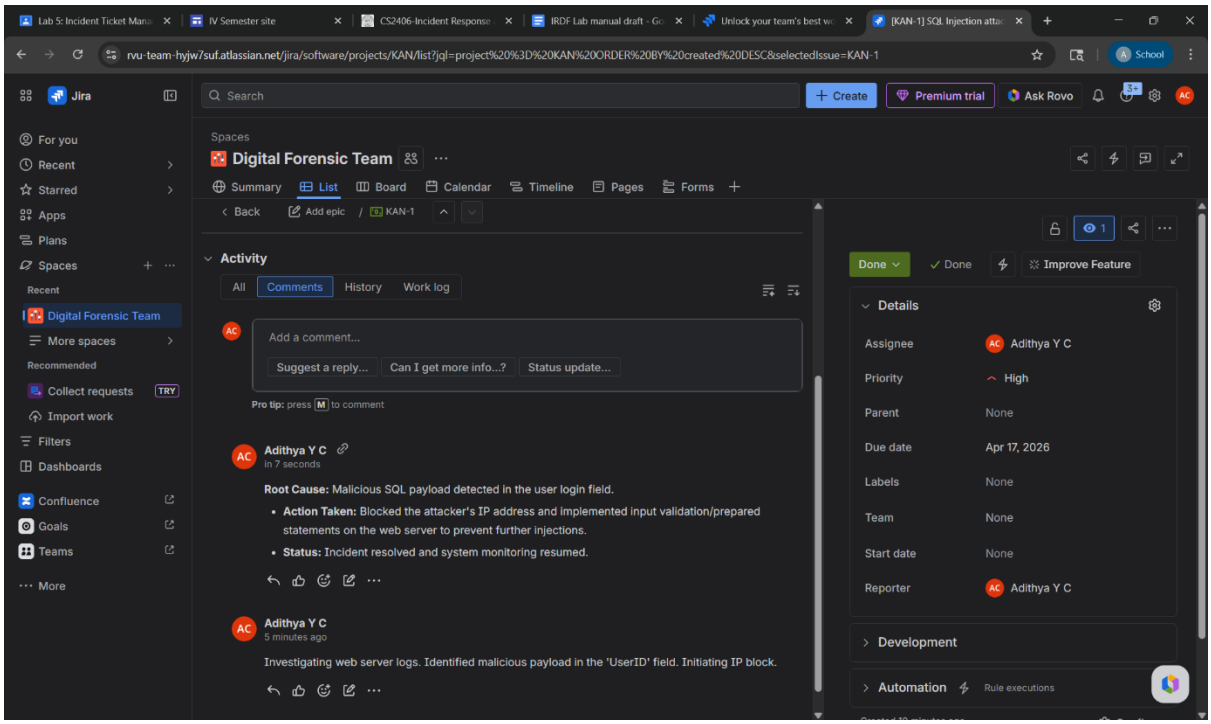
The ticket status is updated to "IN PROGRESS" as the investigation begins, with a high priority assigned due to the severity of the threat. Ownership is also established by assigning the ticket to a specific analyst to ensure accountability.



This view shows the incident being actively managed alongside other tasks, demonstrating the tracking of multiple events within a Security Operations Center (SOC) environment. It highlights the "Assignee" and "Reporter" fields, fulfilling the lab's requirement for clear accountability.



The ticket status is transitioned to "DONE," indicating that the immediate threat has been mitigated. The "Resolution" column is updated to reflect that the case is no longer unresolved.



This final view shows the detailed "Activity" log, including specific comments on the root cause and the technical actions taken to resolve the attack. These notes provide the necessary audit trail for forensic review and officially close the incident lifecycle.
